Innovative Solutions in Material Test Equipment

DSC SERIES UNIVERSAL TESTING MACHINES

The new **DSC Series** of PTS Universal Testing Machines is yet a new line that extends the already comprehensive line-up of PTS material test equipment. This new digital servo control line affords versatility in applications where servo control is required but where it is not practical to have a computer on sight. The **DCS Series** constitutes an excellent solution for production floor applications where the plant environment calls for a digital display instead of a computer. The **DCS Series** can be retrofitted for computer control capability for maximum flexibility in data acquisition, archival and report generation.

The **DSC Series** universal testing machines are available in all PTS electromechanical load frame models and capacities that range from 1 KN to 600 KN. Load frame dimensions and specifications are the same as the rest of the PTS electromechanical products. For more information and specifications, ask for the Compuline product catalog. For pricing information and personalized attention call you nearest PTS sales consultant or contact us directly. The DSC Series load frame models are the following:

TSDS
